

sonible: a solution to all MADI headaches

The new ml:mio by sonible is a universal, compact MADI media converter, splitter and router.

Graz, 5/18/2016 - The new ml:mio by sonible is a universal MADI media converter, splitter and router that brings a new level of flexibility to the table when it comes to handling MADI streams. The compact yet incredibly durable device allows for the conversion of MADI streams between coaxial, optical (SC) and twisted pair signals. Thanks to a fully bit-transparent routing of incoming MADI streams, the ml:mio is compatible with all MADI formats on the market and will preserve any proprietary control parameters.

Flexible Routing

Any input signal connected to this robust little device can be seamlessly routed to any combination of available outputs, enabling your MADI signal to be split and converted at your convenience.

Intuitive Interface

The ml:mio has been designed from the ground up for live usage in the field. As such, it can be used as a standalone device without the need for any external control software. Signal routing can be controlled directly via three sturdy switches on the device itself, with color-coded LEDs to ensure you never lose track – even in the dark.

Maximal Resilience

Live audio can be tough sometimes, which is why the robust exterior of the ml:mio was designed to withstand a beating. Every switch, knob and socket of this device has been carefully constructed to hold up to even the toughest demands of the field without injury.

The ml:mio is available directly from the manufacturer's website for € 699,- (incl. VAT).
